

Creating Your Own Module

1. Make a directory with name eg areas
2. Store all file over there
3. If you want to export is as installable module also make one file named `__init__.py`
no matters if you keep it empty `__init__.py` will say the interpreter to treat folder 'areas'
as libray
4. For importing you can use
Import areas.area as a
`a.getAreaOfSquare(2)`
